

CAPSTONE 2: ISSUES DOCUMENT

General:

- ``var`` keyword is used instead of ``let`` or ``const``. Updated the keyword to either ``let`` or ``const`` depending on the use case.
- Some variables were declared without a keyword. Added ``let`` or ``const`` to fix.
- Some conditionals contained the wrong equality operator, using loose equality instead of strict equality. Refactored to only use strict equality.

File: `index.html`:

- Add input for priority input
- Change type of js files to module
- Add button to sort tasks
- Add buttons to show and hide stats

File: `app.js`:

- Import `generateRandomId` from `utils`
- Add `id` property to `Task` class and assign `generateRandomId` function to it
- Added `toggleCompletion` method to update `completed` property, alternating between `true` and `false`.
- Refactor `getInfo` method to return string literal instead of string concatenation.
- Added `super()` method to `subTask` constructor for proper inheritance.
- Function had a `for` loop that had more iterations than what the array contained. Implemented a `for-of` loop to prevent future error.
- Added the missing parameter to function.
- While loop did not have an increment. Added increment.
- Refactored function `getTaskDetails` to make use of object destructuring.
- Implemented rest parameter and spread operator in `mergeTasks` function.
- Implemented a null check in `calculateAveragePriority`. Also added `Math.round` to round up the return value.
- Refactor `getHighPriorityTasks` function to make use of the `filter` method in order to follow the functional programming paradigm.
- Added type safety checks to the parameters of the function `updateTaskPriority`
- Added base case to the recursive function `countCompletedTasks`. Added type safety checks for parameters as well.
- Implemented check for empty array in `calculateAveragePriority` function. Refactored `for` loop to use the modern `for-of` loop.
- Add methods to `Task Manager` using the functional approach
- Add `export` keyword and all related functions and classes are added

File: `dom.js`:

- Change all string concatenation to template literals
- Use "DOMContentLoaded" to call setupEventListeners.
- Fixed getElementById by correctly assign id
- Fixed querySelector to include id selector
- Added event.preventDefault()
- Added this.reset()
- Added while loop to clear content upon reload and then load the necessary content from memory
- Change innerHTML to insertAdjacentHTML
- Import from [app.js](#) and [utils.js](#)
- Add validation checks for received inputs
- Add null checks for event listeners
- Added buttons with necessary functionality and proper event delegation

File: [utils.js](#):

- Update generateRandomId function to return an integer instead of a floating point number.
- isHighPriority function is fixed to return boolean value.
- isMediumPriority and isLowPriority functions are added that serve a similar purpose to isHighPriority.
- formatTaskName function is fixed to return a string that is trimmed and capitalized.
- formatTaskPriority function is added to format the priority property to return value that is type number.
- Updated SaveToStorage and loadFromStorage functions to use JSON.stringify() and JSON.parse() to better store and retrieve data. Wrap the logic in try-catch blocks since the operations can be considered risky.
- Change priorities data structure from an array to an object
- Add export keyword and all related functions and classes are added
